# Introduction to $\lambda^+$

Yu Feng  
Winter 2021

# Overview

- A  $\lambda^+$  program is simply an expression
- Executing a program = evaluating an expression
- Constant expression: 8
- Arithmetic expression:  $(8 + 9) * 2$

# Let bindings

- Let bindings in  $\lambda^+$  allow us to name and reuse expressions
- An expression of the form **let**  $x = e_1$  **in**  $e_2$ :
  - bind the value of  $e_1$  to identifier  $x$  and evaluates  $e_2$  under this binding
  - $e_1$  is called the initializer
  - $e_2$  is referred to as the **body** of the let expression
- **let**  $x = 3+5$  **in**  $x-2$  evaluates to 6
- **let**  $x = 3+5$  **in**  $x+y$  yields a run-time error due to undefined variable  $y$

# Let bindings

- Let bindings in  $\lambda^+$  can be arbitrarily nested

`let x = 3+5 in`  
`let y = 2*x in`       $\longrightarrow$       24  
    `y+x`

`let x = 2 in`  
`let x = 3 in`       $\longrightarrow$       3  
    `x`

# Function definition

- Function definition:
  - **fun** *f* **with**  $x_1, \dots, x_n = e$  **in**  $e'$
  - *f* is the name of the function being defined,  $x_1, \dots, x_n$  are the arguments of function *f*, and  $e$  is the body of function *f*

**fun** **plus** **with**  $x, y = x + y$  **in**  
    **plus** 2 3

→ 5

**fun** **fact** **with**  $n =$   
**if**  $n=0$  **then** 1 **else**  $n * (\text{fact } (n-1))$  **in** **fact** 3

→ 6

# List operations

- The empty list constant Nil
- The cons cell  $e_1 @ e_2$ , where  $e_1$  is the head of the list and  $e_2$  is the tail of the list
- The expression  $!e$  yields the head of the list.  $!(2 @ 3 @ Nil)$  evaluates to 2
- The expression  $\#e$  yields the tail of the list.  $\#(2 @ 3 @ Nil)$  evaluates to  $3 @ Nil$

# Lambda expressions
